

## Control Procedure

Before beginning the survey, the participant must complete a consent form. Then they will be given the survey. The survey will consist of 12 sentences chosen from a pool of sentences gathered from a random sentence generator with associated questions. The participant will be asked to score each sentence from 1-10 corresponding to how natural the passage sounded, as well as scoring each sentence from 1-10 for the strength of association between the passage and each of the following categories: anger, fear, joy, and sadness.

## Experimental Procedure

For the experimental procedure, original sentences will be gathered by the same random sentence generator, and will be fed through a word replacement model. Participants will answer the same questions for each sentence as in the control: the participant will be asked to score each sentence from 1-10 corresponding to how natural the passage sounded, as well as scoring each sentence from 1-10 for the strength of association between the passage and each of the following categories: anger, fear, joy, and sadness.
